Support frame

Preliminary notes

The following load charts are based on the assumption that the fresh-concrete pressure (maximum hydrostatic fresh-concrete pressure for normal concrete, specific weight  $\gamma = 25 \text{ kN/m}^3$ ) acts over the entire height.

For heights greater than 6.00 m, we recommend determining the fresh-concrete pressure as a moving load according to DIN 18218 as a function of end of setting  $t_e$  and the rate of placing (see pages STB-110 to STB-115).

The anchoring takes place by means of the anchor loops encased in the concrete or by means of straight tie rods (in pairs).

Permissible anchor loads (for 2 tie rods) in kN		
	Anchor loops	Straight tie rod
DW 15	2 x 85 = 170	2 x 90 = 180
DW 20	2 x 150 = 300	2 x 160 = 320
DW 26.5	2 x 245 = 490	2 x 250 = 500

Deflection forces for support frame STB 450:

The tie rods are installed at a 45° angle. As the resultant force generally acts a larger angle, this results in a deflection force.

- Key:
- $\alpha = \arctan (V/H)$
- $\gamma = \alpha - 45^\circ$
- Tensile force on tie-rod  $Z = \sqrt{(H^2 + V^2)}$
- Deflection force  $U = \sin (\gamma/2) * Z * Z$
- $\delta = (90^\circ - \gamma)/2$
- $U_V = U * \sin \delta \rightarrow$  rebar required for  $U_V *$
- $U_H = U * \sin \delta \rightarrow$  rebar required for  $U_H *$

\* The existing rebars can be taken into account. Thus, it may not be necessary to install additional rebars.

Moving load:

The concrete that has already set no longer exerts pressure on the formwork. Thus, the concrete pressure is only to be take into account as a moving load up to the end of setting  $t_e$ .

$h = 5 h \times 0.8 \text{ m/h} = 4.00$
